

## **Mapping a network drive for your Mac**

This method allows you to reboot your Mac and have the mapped network drive automatically remount and appear on the desktop. This is more persistent than the above method.

1. From the Finder, hit Command+K
2. Enter the path to the network drive you want to map
  - H: drive - smb://fileshares.louisville.edu/usr/userID
  - I: drive - smb://fileshares.louisville.edu/data
3. Click Connect
4. Enter your ULink userID and password (type ad\ before your userID: ad\ userID) and click OK
5. The drive is now mounted. Continue on to map for system reboot persistence
6. Now enter into System Preferences, from the Apple menu
7. Click on Accounts
8. Click on Login Items
9. Click on the + button to add another login item
10. Locate the network drive you previously mounted and click Add
11. Exit out of System Preferences

Your network drive will now be mapped and automatically remounted when you reboot your Mac.
